As a general rule, ball bearings are used at higher speeds and lighter loads than are roller bearings. Roller bearings perform better under shock and impact loading. Ball bearings are usually sold as assemblies and are simply replaced as units.

Roller Bearings vs. Ball Bearings - What's the Difference?

The surfaces of the bearing are generally flat or cylindrical. And they may consist of nonferrous metal surfaces known as bushes or hardened steel races supported by steel balls or rollers. In the above case, the bearing known as bush bearings, and in the latter known as a ball or roller bearings. Types of Bearings

Precision ball bearings are designed to have a long and useful life. Assuming the application is correct to begin with, maximizing longevity means bearings must be properly installed, lubricated and maintained. Poor operating environments, particularly moist or contaminated areas.

BEARING FAILURE: CAUSES AND CURES

The life of a rolling element bearing depends to a large extent on the smoothness of the contacting surfaces – the balls, rollers, and races. Typical surface roughness dimensions for production bearings are as follows: Balls 2– 3 μm . rms Ball races 6–10 μm . rms Rollers 8–12 μm . rms Roller races 10–20 μm . rms
