An automatic voltage regulator is a thyristor type voltage controller which will maintain the output voltage of the alternator whenever voltage fluctuations occur due to varying loads. AVR achieved this by controlling the excitation of the alternator. Whenever a voltage dip occurs then it will increase the excitation and vice versa.

Basically the AVR or Automatic Voltage Regulators function for generator is to ensure voltage generated from power generator running smooth to maintain the stable voltage in specified limit. It can stabilize the voltage value when suddenly change of load for power supply demand. If the generator running in parallel condition, the AVR can controlled the voltage [...]

Transistor Series Regulator Since Q 1 is an npn transistor, V_o is found as: the response of the pass-transistor to a change in load resistance as follows: If load resistance increases, load voltage also increases. Since the Zener voltage is constant, the increase in V_o causes V_{BE} to decrease. The decrease in V_{BE} reduces conduction through the pass-transistor,

Chapter 6: Voltage Regulator - Ajlon Tech

The automatic voltage regulator is used to regulate the voltage. It takes the fluctuate voltage and changes them into a constant voltage. The fluctuation in the voltage mainly occurs due to the variation in load on the supply system. The variation in voltage damages the equipment of the power system.

Voltage Regulator circuit with schematic diagrams

Voltage regulators are commonly found in vehicles and other electronic equipment. A voltage regulator will limit the maximum amount of voltage from a power source and prevents a device or alternator from shorting and overheating. Signs of a bad voltage regulator in a vehicle include dimming or pulsing lights or a dead battery. If you have electrical equipment that won't turn on, that could ...

Automatic voltage regulators are used on generator sets on ships, in emergency power supplies, on oil rigs, etc. to stabilize fluctuations in power demand. For example, when a large machine is turned on, the demand for power is suddenly a lot higher. The voltage regulator compensates for the change in load.
