We will use special formulas for special types of problems: Theorem. (TYPE I. Integral from a rational function in sin and cos.) If $Q(a;b)$ is a rational function of two complex variables such that for real $a;b$, $a^2 + b^2 = 1$ is $Q(a;b)$ nite, then the function $T(z) := Q z+ 1=z^2; z 1=z 2i =(iz)$ is rational, has no poles on the real line and $Z 2^0$

For complex problems, Solver can generate multiple solutions. You then can save these solutions under different scenarios, as described later in this chapter. Solver is a powerful tool that most Excel users don't need. It would be overkill, for example, to use Solver to compute net profit given fixed revenue and cost figures.

Expressions containing complex variables, parameters, or constants may be complex valued. The functions `is_real`, `is_complex`, and `is_imag` return whether an expression is purely real, complex, or purely imaginary, respectively. ... For example, `problem.solver_stats.solve_time` gives the time it took the solver to solve the problem.

The Simplex LP Solving method is designed for these problems. If your objective and constraints are smooth nonlinear functions of the decision variables, solution times will be longer. If the problem is convex, you can be confident of finding a globally optimal solution, but if it is non-convex, you can only expect a locally optimal solution ...

Derivation. We know (from the Trivial Inequality) that the square of a real number cannot be negative, so this equation has no solutions in the real numbers. However, it is possible to define a number, i , such that $i^2 = -1$. If we add this new number to the reals, we will have solutions to $x^2 + 1 = 0$. It turns out that in
