An important feature of ducts near the equator is that their electron density profiles are smooth enough so that the density does not vary appreciably within a local wavelength. Measurements of the spatial distribution of the fields shown that the picture of electromagnetic field propagation is much more complicated in the nonlinear case than it is at linear power levels.

Electrodynamics of Density Ducts in Magnetized Plasmas

The density magnitude inside the duct is set equal to $n_i = 2.5045E + 8 \text{ m}^{-3}$, and the density magnitude outside the duct is $n_o = 0.9E + 8 \text{ m}^{-3}$. These values of $k_{\perp 1}$, ω , and n_i provide $k_{\perp 1} = 2.047E-3 \text{ rad/m}$ and $k_{\perp 2} = 1.024E-3 \text{ rad/m}$, which values satisfy the condition $k_{\perp 2} = 2 k_{\perp 1}$ inside the channel.

While the hypothesized existence of field-aligned density ducts accounts for a large body of experimental data [Ohta et al. , 1996; Singh et al. , 1998; Carpenter and Smith , 2001], it has not been previously possible to directly verify that large, cylindrical density structures greatly extended along the Earth's magnetic field lines exist or ...

The nonlinear resonant interactions between whistler waves guided by density ducts surrounded by a uniform magnetized plasma are studied. It is shown that, under specific conditions that are determined, a time-harmonic external electromagnetic field can drive the parametric instability of guided whistlers.

The duct acts as a helical antenna based on electromagnetic and antenna theory; the dimensions of the duct and the dielectric properties of the surrounding medium are major factors that determine the resonance frequency 33. Therefore, sweat duct dimensions, density and distribution as well as the dielectric properties of the stratum corneum are crucial in determining the resonating frequency range, which will enable further insight into THz wave interactions with human beings.
