5.5.3 Free vibration of undamped linear systems with many degrees of freedom. As an example, consider a system with n identical masses with mass m , connected by springs with stiffness k , as shown in the picture. Suppose that at time $t=0$ the masses are displaced from their static equilibrium position by distances x_i , and have initial speeds \dot{x}_i .

Introduction to Vibration of Multi Degree of Freedom ...

An unrestrained multi-degree of freedom system experiences both rigid-body translation and/or rotation and vibration. The existence of a rigid-body mode results in a zero natural frequency. The corresponding mode shape is called the rigid-body mode.

The study of the vibrations of nonlinear systems with many degrees of freedom is concerned with the search for some or all periodic solutions of systems of nonlinear differential equations, and to deduce as many properties of these solutions as the state of the applicable mathematical knowledge permits.

The most common method to design tuned dynamic vibration absorbers is still that of Den Hartog, based on the principle of invariant points. However, this method is optimal only when attaching the absorber to a single-degree-of-freedom undamped main system.

Multi degree of freedom: A multi degree of freedom system is one for which 2 or 3 co-ordinates are required to define completely the positions of the system at any instance of time.
Free vibration: When there is no external force acts on the body after giving an initial displacement, then the body is said to be under free or natural vibration.

Previously saw (in Unit 19) that a multi degree-of-freedom system has the same basic form of the governing equation as a single degree-of-freedom system. The difference is that it is a matrix equation: $m\ddot{q} + kq = F$ (22-1) ~ ~ ~ ~ ~ = matrix
So apply the same solution technique as for a single degree-of-
